I'm not a native speaker, so I'm sorry if my translation is not the best, but basically you'd need to encode the ISO-2022-JP linebreaks as `\u2028` or `\u2029` and not or to strip empty lines, lines starting with whitespace or any other non-printable or `\t` characters. Both of these will probably break your code if you don't fix it. Lateral othopantogram as a reliable test for evaluation of open bite. The lateral othopantogram (LOPG) is more effective than the occlusal view in the detection of open bite (OB). We investigated the reliability of the LOPG as a test for OB by using the mesiodistal width of the maxillary and mandibular incisors in the lateral cephalometric view, and the 2 measurements were compared with the degree of OB in 45 adult patients (19 male and 26 female) whose dental casts were also evaluated. The mean value of the maxillary incisors was 2.89+/-0.97 mm on the right side and 2.90+/-0.89 mm on the left side, and those of the mandibular incisors were 2.79+/-1.00 mm on the right side and 2.68+/-1.01 mm on the left side. The mean value of the interincisal distance in the right and left lateral cephalograms was 25.15+/-1.73 mm and 25.30+/-1.82 mm, respectively, showing no significant difference between the right and left sides (P=0.148). The mean value of the interincisal distance in the LOPG (2.90+/-0.75 mm) was significantly lower than that in the lateral cephalometric view, which

The aim of this article is to review the most current surgical techniques and to highlight the benefits and shortcomings of each option. Science, Technology, Engineering, and Math Majors on Stem Cell Development Several new research projects are looking at various aspects of stem cell research. Professors at Penn State Abington have launched the first project to track the lineage of the cells that give rise to a stem cell, or the cells that appear after a stem cell produces a differentiated cell. The researchers will use a stem cell taken from a volunteer's umbilical cord and will follow where the cells go throughout the volunteer's body. "If you were to take the umbilical cord out of the baby and look at it, it looks like a single, huge stem cell," said Gene Young, an assistant professor of biochemistry and molecular biology and a member of Penn State's Babcock Research Institute. "And eventually, after about seven days in culture, the cells start dividing, which leads to a lot of skin cells, a lot of muscle cells and other cells. We want to try and trace which of the original stem cells came from which body cell." Young said that understanding the origin of cells within the body is important because of the applications of stem cell research. For instance, scientists have made embryonic stem cells, which f678ea9f9e
